

Adding onto last week's assignment of a basic completed image, I successfully moved specific objects around inside of itself. For instance, I used a ton of "else if" statements to move various pieces such as olives, peppers, and pepperonis. Another example is creating basic "if" statements where I essentially produced loops with exactly four shapes (three pepperonis and one green bell pepper). As for ChatGPT, it created the same artwork that I produced. However, the colorization in the still bell peppers are different. Instead, the three still bell peppers are black rather than green. In conclusion, it was a very fun revisit on dealing with conditionals in python.
